

SIX-CORE VALIDATION

Core1 -> Core1A -> Core1B | Core2 -> Core2A -> C

End-to-end review of authority, pedagogy, static product boundaries and mathematical answer custody for one sample topic.

This sample demonstrates:

- Core1 = semantic/PCK authority.
- Core1A = build understanding. Core1B = reconstruct/consolidate.
- Core2 = assessment cognition. Core2A = legal transfer pool. Core2B = selected static transfer.
- Compiled product != learner evidence.

Sample topic

A point on an axis equidistant from two fixed points

Generated review fixture - not an official exam source

1. Responsibility test

Each layer must answer a different question.

Core1

What is mathematically true, connected, valid and easily misconstrued?

Core1A

How should required understanding be built?

Core1B

Can the static product require reconstruction with fading support?

Core2

What does this problem family demand, hide, vary and test?

Core2A

Which transfer/practice items are legal to publish?

Core2B

How is legal transfer exercised in a fixed workbook under a ceiling?

2. Audit result

The architecture is functionally distinct and mathematically consistent for this sample.

PASS

Core1 shortcut validity is derived from the general model.

PASS

Core1A teaches representation and equation meaning before independent use.

PASS

Core1B uses open-ended attempt + staged self-help + detailed bottom answer.

PASS

Core2 identifies first move, wrong chain, difficulty and transfer envelope.

PASS

Core2A legal items are generated/provenance-safe and answer-checked.

PASS

Core2B selects only legal IDs and stays below M5.

CORRECTION

EQ-H1 gives $x=1/4$, not $x=1$; the review fixture uses the corrected answer.

BOUNDARY

Static B products cannot claim learner attempt, learning, retention or transfer-readiness.
