

Six learner contracts are different jobs

STUDY SIDE

Core1 = compact notes. Core1A = complete declarative teaching. Core1B = elicitation-first concept reconstruction.

QUESTION SIDE

Core2 = frozen questions + ladder help. Core2A = guided deliberate practice with full repair. Core2B = coached problem solving that forces move selection before solution exposure.

Control axes and authority boundaries

CORE1 SERIES

This subtopic is HARD because depth follows intrinsic Chemistry difficulty, not student knowledge. The set uses only the governed symbolic Redox representation and does not invent particle-level scenes.

CORE2 SERIES

Student knowledge percentage was not supplied. This review fixture uses an explicit owner override; no learner percentage is fabricated. The override changes support only, not Chemistry truth or frozen question identity. The three questions are owner-frozen review inputs; their wording/answer custody is shared across Core2/Core2A/Core2B.

Self-help closure and falsifiers

COMMON CLOSURE

Every learner task has ATTEMPT -> SUPPORT -> CHECK -> REPAIR -> RETRY/TRANSFER. Open-ended never means answerless.

RELEASE FALSIFIERS

Reject if Core1 depth depends on learner percentage; if Core2 conditioning is unresolved; if B layers add live runtime fields; if Core2B invents new questions; if role labels are given without self-change evidence; if symbolic representation authority drifts.

Review verdict

PASS

The six artifacts share one chemical truth but produce six different learner actions. Core1A/Core1B share the HARD bucket; Core2A/Core2B share owner conditioning; all tasks close with answers/checks; no mastery claim is inferred from artifact completion.

NEXT VALIDATION

Repeat the six-core fixture on a second Chemistry family with different representation demands before treating the architecture as broadly mature.
